

**As we all Fight against the
Impacts of Covid-19**

**We're here for you....
and the health of your business.**

1st Team Air Conditioning wants our valued Customers to know we are open for business. We have made a few changes in order to provide a safe work environment but our doors remain open so for our customers. We know that you might be concerned about the health and safety of your business and are here to provide any support that you need through these tough times.

A Few Things to Consider,

- Maintaining good indoor air quality requires attention to the building's heating, ventilation and air conditioning (HVAC) system.
- These systems can have a significant impact on how pollutants are distributed and removed.
- HVAC systems can even act as sources of pollutants in some cases, such as when ventilation air filters become contaminated with dirt and/or moisture and when microbial growth results from stagnant water in drip pans or from uncontrolled moisture inside of air ducts.
- Because of the HVAC system's importance, good indoor air quality management includes attention to such things as Diligent maintenance of HVAC equipment, it's essential for the adequate delivery, health and quality of building air.
- All well-run buildings have preventive maintenance programs that help ensure the proper functioning of HVAC systems.
